The firebird book a reference for database developers pdf

Firebird is an open source / client server RDBMS (Relational Database Management System). It is based on an open source version of InterBase, but grew to beyond this. Delphi Support [] InterBase native components generally work well with Firebird, but as InterBase and Firebird diverge in the future this may not be the case. [] AnyDAC [] high-speed, direct and universal access Delphi component data for Firebird, Interbase, MySQL, PostgreSQL, SQLite, MS SQL Server, Oracle, DB2, SQL Anywhere, dbExpress and ODBC data sources, and more, that simplifies the task of building Delphi, C ++ Builder and FPC database applications. IBExpert [] A database development tool for InterBase and Firebird. There is a free personal version and a more functional commercial version, available with a trial. IB [] objects IB Objects is a native VCL component suite for direct access to InterBase and Firebird. One thing that is very cool with this package is that you can switch from the BDE to direct connectivity Interbase / Firebird in no time. 'InterBase Data Access Components (IBDAC) [] IBDAC from Devart is a library of components that provides access to the database server InterBase, Firebird and Yafil. IBDAC uses the InterBase client directly to connect to the server. In addition to the minimum set of standard Python DB API function, this driver also exposes the new (interface-based) client API introduced in Firebird 3, and the number of extensions and further improvements for a comfortable use of Firebird RDBMS. This documentation set is not a tutorial on SQL or Firebird; rather, it is a topical presentation driverá ç s feature set, with sample code to demonstrate basic usage models. For detailed information on Firebird features, see the documentation Firebird, and especially the excellent book The Firebird written by Helen Borrie and published by IBPhoenix. See also the firebird-lib package for optional extensions for this pilot. driver development is sponsored by IBPhoenix. Go to bed before messageunread, October 12, 2010, 04:59:14 PM 10/12 / 10! Leen por This article I found: What do you use Firebird SQL? Mia © RCOLÉS, April 29, 2009 Leave a comment Go to comments Á. Why few developers are using Firebird SQL? It has been the formulated question formulated Henrique Lobo on his blog ltext has concluded that the thought that there are not many developers is to be in a big mistake, because there are more developers who use Firebird from which you believe and this number is rapidly growing; Developers are realizing the advantages of the advantages of other databases such as MySQL: Á ç á~ main Á "ComptterÁ ç á~. At first glance, it seems that those who use Firebird are developers in Delphi. Although the number of developers using this engine is still reduced, because it is not so popular like MySQL or PostgreSQL? Perhaps, as shown on the SQL Firebird website: as you probably noticed, Firebird is more mature, who have more functions, it's not a penny worth it and is sure that it is more prepared for business environments. So why are there no many people who have heard from this engine? The reasons are simple: 1. Firebird does not have a unique commercial entity that manages the development and earning money for this. There are companies, but none of them get earnings for the sale of Firebird licenses (Firebird is completely free). These companies sell support, but the economic return is much lower. Therefore, there is no one to invest your money in marketing and make a distribution around this project. Similar problems are placed other open code projects, such as postgresql, for example. 2. When the web server boom and web applications, Firebird was not ready to be a web database. Since the data storage application has grown, people asked for something easier and easier than the Perl type flat files. MySQL was simply in the right place at the right time. Soon, each ISP (Internet Provider) has been support for PHP and MySQL and the lamp platform has been accepted. As happens, those first in a new market, have been quickly accepted, and it is very difficult for others to let it Á ç á~ Á "The" Market leaves. It can be unjust, but many developers have begun to reconsider it. But maybe what features does this engine have to deserve the attention of the developers? Well, frozen under: * Really free: contrary to MySQL, Firebird that can be used in commercial applications without any kind of á~ Á HonorariosÁ ç á~ or legal problems. (It is worth mentioning that PostgreSQL has also this advantage) * All the basic features of large RDBMS: stored procedures, triggers or triggers, ACID, hot backup, generators, referential integrity, And a great etc. * low resource consumption: have you ever seen an integrated database? Simply surprising: in less than 1 mb it is possible to have all the features of the database without Á ç á~ Á "cort youÁ ç á~ nothing ! * R Equipped low hardware: essentially, if something performs informal operations, you can easily run Firebird. * Available on all large platforms: Linux, Windows, Mac OS, Solaris and others. * Reasonable performance: Firebird's performance is just as loaned by MySQL and PostgreSQL. * Pretty active project: despite its low popularity, s a rather active project. For example, in April 2009, the beta version of version 2.5 of the project was announced. * Unlimited Database Dimensions: The database size quarrel is determined by the system file where the database is stored. But, in the event that the database exceeds the limit, it is always possible to divide it into multiple files. (The largest known database occupies more than 980 GB) * 100% compatibility with the SQL 92 * Connectivity standard: SQL Firebird can be accessed through any programming language. And if we talk about tools to manage Firebird there are several. So there is also a program that serves to convert from MS Access to Firebird. Although it is a database for Á ç á~ Á ç á~ Á "naming and use every day, sometimes it is difficult for a customer to give it acceptance to MySQL or PostgreSQL. Other reasons you could be contemplated for that Firebird is so unpackable are: * For now, no big company provides support like Sun / Oracle or IBM. * The official website () does not seem graphically attractive, so that the first impression is usually the best. Anyone would think that it is abandoned. The largest sponsor today today is ibphoenix, and its main activity is Firebird. But even your website (that of IBPhoenix) falls on the same problem as the Graphic Design. * The fact that it has always been associated with Delphi from the beginning produced that with the decadence of Delphi, the Firebird popularity fight also to stay afloat. * Lessed documentation: It is difficult to find documentation and in Spanish even more. Both as and, it is a project that promises a lot and I believe that this strip of Á ç á~ Á "InjusticiaÁ ç á~ will pass and will be able to position itself and make yourself known. I first and most likely say like me: Á ç á~ Á "because I do not betaÁ ç á~ ..unread, 13 October 2010 SO, 06:02:24 PM10 / 13 / 10A2~ Enter to answer AuthorYou do not have permission to delete messages in this groupSign to report message as abuseEither email addresses are anonyms for this group or you need the view of e-mail addresses the permission to see The Original Messagehola Miguel, at the beginning of the year change my vip 7 to vip 9. I am migrating all my applications and those who were being developed I am doing them with mysql bd, at that moment I was at the point where I imagine these you, as a bd engine to use Even from VFP's native, my alternatives were: Firebird and MySQL, I did the test with the two and both seemed very good, now, because I decided by MySQL?, practically for everything that is commented on this text passing, with Firebird there are few information, the appearance of abandonment, St. Limited rates (according to my brief investigation) to the many more and more accessible menu those of MySQL ... anyway, I am planning to make my applications not according to an only BD, which the end user during the installation of Application or its needs, I can select the BD with which you will work, DBFS, MySQL or Firebird. Here in Máf © © Xic I can have several companies that develop in Delphi, Power Builder and other languages and use Firebird, comment on their experiences that is the best option to take, even on MySQL or PostgreSQL, one of them It has a very large development that serves a chain of restaurants throughout the country (Mexico) and all supported with Firebird also that some of their processes are made with SQL Server for the ERP that manages this company the functional structure is Firebird. So in my opinion, develop applications so that they can work with both DBFS (VFP) and another or other databases like MySQL and Firebird. And if you have to choose one and opt for Firebird I suggest you look for someone who has experience using it with which you can support, because there are very few information. I also recommend that you look for this book: the fire bird Book: Reference for Helen Borrie database developers and IBPhoenix ISBN (PBR): 1-59059-279-4 Very good and complete, but in English (clear PSSTT); Look for information about Interbase, much of this serves you for Firebird. Well, I hope I helped something. Greetings, Arturo Ramos www.ircsasoftware.com.mx www.ircsasoftware.com.mx the firebird book a reference for database developers pdf
