If you are unable to answer the question, we are here to help you by providing NCERT Class 11 Physics Solutions. From the point of view of preparation, there is no better way than the NCERT (National Council for Educational Research and Training) solutions for Class 11 of Physics. We understand the problem students face during their learning. As a result, NCERT Solutions is created by plain language experts so they can use it to learn as they wish. Now, you don't have to wait for classroom teaching as these documents are designed to help you get good grades on your exam. Going through the NCERT solutions of Motion into a Straight Line will help them understand the topic very well. NCERT Solutions: Straight Line Movement To understand and remember the concepts read in Physics Class 11, asking questions at hand further enhances problem solving skills. To this end, EduRev provides the best short and long questions for the Physics class 11. The questions are sorted appropriately for the convenience of the student. We recommend solving all the short and long questions in that Chapter. Practicing additional questions will give clarity about the concept of that Motion in a Straight Line. In this motion the object moves in a plane. Three-dimensional movement: - The motion is said three-dimensional if all three coordinates specifying the position of an object moves into space. Length of the route: - The length of the route path from an object move in the object moves in the object moves in the object move in the object m object between two points is not always the same size as the shift. The move depends only on the final points, while the length of the path is greater than the size of the shift. Average speed: The average speed of an object is greater than or equal to the size of the shift. Moving A move is the minimum distance between the initial and the final position of a P point. So, it is the length of an imaginary straight path, typically distinct from the path actually routed by P. A moving vector represents the length and direction of this imaginary straight path. The size of the shift is equal to or belowactual travelled by the object in the given timeDisplacement is effective distance Speed is the rate of change in the distance covered by the body compared to time. Speed = Distance travelled / time taken Speed is a scalar quantity. Its unit is meter /sec. Dimensional formula of velocity: If an object covers equal distances in equal time intervals, the velocity of the moving object is called uniform velocity. In this type of motion, the "time" position graph is always a straight line. Instant Speed:- The speed of an object in a given instantaneous speed = average speed = uniform speed, its instantaneous speed = average speed = uniform speed, its instantaneous speed = average speed = uniform speed. Velocity:- The speed of change of position of an object in a given instantaneous speed = average speed = uniform speed. equal to the movement of an object per unit of time. Speed are equal. Acceleration: â The rate of change of the velocity of an object with respect to time is called its acceleration. Acceleration = change in velocity / time taken It is a vector quantity, its unit YES is meter/ sec2 Its size is [MOL1 T -2]. It can be positive, negative acceleration: If the speed of an object decreases with time, its acceleration is negative. Negative acceleration is also called retardation or deceleration towards the ground from a small height. This is called a free fall. The acceleration with which a body falls is called gravitational acceleration (g) and has a value of 9.8 m/sec2. Relative velocity. Relative velocity of object A with respect to object B, VAB = VA â VB When both objects move in the same direction, then the relative velocity of object B with respect to object A, VAB = VB â VA When both objects move in the same direction, then the velocity Relative of Object B moves in the opposite direction to Object B moves in the Object B moves in the Object B available for reading or download from this page.
